ABSTRACT OF THE DISCLOSURE

An electro-luminescent lighting device includes many different kinds of electro-luminescent lamps and bases. The electro-luminescent lighting device has a luminary and multiple individual extending electrodes connected to electrical conductors. A surface of the electric conductor extends out of the main body the lighting device. There are many holes or 5 crevices in the base going through two ends of the base. The extending electrode individually or simultaneously goes through these holes or crevices to be fixed in position. The luminary is arranged in the one end of the main body of the base, and the extending electrode is arranged on the other end of the base. The tail of the electrical conductor is arranged closely to the outside wall of the base. Its electric conductor faces outward to an expected position of the power and 10 connects the luminary to the power. The luminary displays expected shapes, colors, style, words or results.
